

INTRODUCE A NEW PIGGING PRODUCT:

Turbulent Flow

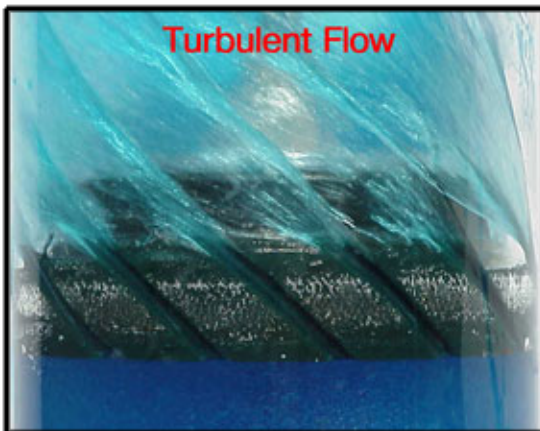

JETTING CUP

2"-36"

Description:

The unique design of Jetting Cup patent pending gives the user all the advantages of most Scraper cup plus the added advantage by jet away debris from in front of the cleaning pig. The grooves in the surface of the cup allow a calibrated amount of fluid to pass along the wall of the pipe to jet away wax, sand and other debris. The Jetting Cup works well in pipelines transporting all types of commodities such as oil, liquid gas, water and gas. It will eliminate those large accumulations of wax in scraper traps when cleaning pipes are received. The grooves on the face of the cup provide double the scraping action on the pipe wall. The design of the jetting grooves causes the pig to rotate as it travels ensuring even wear of the cup, increasing cup life and reducing operating costs.

Features:

- Jetting action to remove wax from in front of pig
- Improved removal of wax from pipewall.
- Even wear of sealing element.
- Less wax to manage in traps.
- Reduced operation cost.
